

Kingfisher News

In September, we feel that the temperature is dropping little by little in the morning and evening. In addition to the intense heat that has continued for days, fronts have stalled across the country, causing heavy rain. We felt like we were back in the rainy season. The heavy rains are caused by the collision of warm, moist air from the Pacific high and cold air from the continent near Japan. It is very worrying that the cold air continues to flow in at this time of year.

Topic

We made new panels (2).

This time, the topic is "Have CO2 emissions decreased due to the effects of the new coronavirus? (2)".

The following content is based on the Global Energy Review: CO2 Emissions in 2021 report published by the International Energy Agency in March 2022.

Perhaps the most surprising thing is that global CO2 emissions in 2021 reached a record high of 36.3Gt. Despite holding international conferences and enacting the Paris Agreement, it seems that they have not been able to reduce it at all.

In particular, China recorded a record-high emission of 11.9 Gt, and finally accounted for one-third of all emissions by a single country. The reason for this is said to be that a new coal-fired power plant was installed to secure electricity. Other countries have also increased their emissions, with the US at 6.7%, India at 10.7% and the EU at 7.4% compared to 2020. By the way, in Japan, it was an increase of 1%.

When will they come to consider not only the reduction of CO2 emissions but also policies to actively remove CO2 from the atmosphere?

新型コロナの影響でCO₂排出量は減少したのか(2)

新型コロナにおけるCO₂の排出量の変化②

国際エネルギー機関(IEA)がこのほど発表した「Global Energy Review 2021」によると、2020年に大きく落ち込んだ世界の二酸化炭素排出量が2021年に大きくリバウンドしていることが判明しました。

※中国の2021年の二酸化炭素排出量は、11.9億トンに達し、世界の排出量の33%を占めました。

2021年の米国の二酸化炭素排出量は、2019年の水準を4%下回りました。日本では、2020年に排出量が3.7%減少したものの、2021年には約1%程度増加しました。
